The Infrastructure Blueprint

What it actually takes to land in the inbox - the unglamorous foundation every good cold email campaign is built on.

WHY THIS MATTERS FIRST

The best copy is worthless if it never arrives

A great niche and a great email still fail if the message lands in spam. Deliverability is invisible right up until it quietly caps a campaign's results - and by the time it's obviously the problem, real damage to sending reputation has usually already been done. This is the foundation, in the order it actually gets built.

SENDING INFRASTRUCTURE

Start with real mailboxes, not experiments

01 **Google Workspace over custom SMTP**

Skip the DIY mailserver phase entirely - it's a common early mistake that costs real time and money before ever sending a real email. Established, reputable mailbox providers get treated with far more trust out of the gate.

02 **1 domain to 3 mailboxes**

Keep the ratio disciplined from the start - spreading volume across too few domains concentrates risk, and too many mailboxes per domain looks exactly like what it is.

DOMAIN AGING & WARMUP

Reputation takes time - don't compress it

03 **Let domains age before warmup even starts**

A domain registered yesterday isn't treated the same as one that's been live for months, even after a full warmup cycle - that reputation signal doesn't come from warmup alone. Registering and parking domains early, so they're already aged by the time a campaign needs them, avoids ever having to choose between a launch date and a domain's real age.

04 **Minimum 30-day warmup - and don't stop it**

Warmup needs to run **simultaneously** with the live campaign once it launches, not stop the day sending begins. Turning it off the moment real volume starts undoes the trust it just spent a month building.

VOLUME DISCIPLINE

Scale infrastructure, not volume per mailbox

20/day	20/day	40/day
cold outreach, per mailbox	ongoing warmup, per mailbox	total output, per mailbox

To send more, add more domains and mailboxes - never push an existing mailbox past a disciplined daily volume. The failure mode of "just send more from what's already warmed up" is exactly how a working setup burns its own reputation.

THE MESSAGE ITSELF

Plaintext, personalized, no links or images

Plain text, no embedded links, no images, and heavy real personalization (with spintext where it's used) keeps a message looking like it was written by a person to one recipient - not a mass blast run through a merge tool. Every visual "enhancement" is also a spam-filter signal.

TRACKING THAT MISLEADS

Turn off open and click tracking

SKIP THIS METRIC ENTIRELY

Open and click tracking mostly measures bot and scanner traffic at this point, not real human attention - and the tracking pixels themselves are a deliverability liability. The only number worth optimizing is replies, because a reply is the only signal that ever turns into a conversation.

ONGOING, NOT ONE-TIME

Deliverability needs continuous monitoring

A setup that was healthy at launch can quietly degrade weeks later - it isn't something you configure once and forget. Monitoring needs to combine both sides: how the campaign is actually performing, and the underlying health of the sending infrastructure itself. Catching a drop early is the difference between a one-day fix and a burned domain.

> *"Reputation takes months to build and a single bad week to damage. Treat the infrastructure with the same discipline as the message."*

THIS IS THE PART THAT'S EASY TO GET WRONG ALONE

Infrastructure discipline, without running it yourself

Every step above is a real operational burden - domain aging, warmup pacing, volume discipline, and monitoring, sustained for as long as the campaign runs.

HOW SWEEPER EXECUTES THIS

Protect the sender reputation your replies depend on

Campaigns are paced and personalized by the platform itself, so the infrastructure discipline this guide describes isn't a separate job someone has to manage by hand, and a burned domain never quietly kills a campaign's reply rate without anyone noticing.

- → Every email is written fresh per contact, no spintext templates to maintain, so volume never comes at the cost of the personalization that earns a reply.
- → Sequences and daily pacing are configured once per campaign, not micromanaged mailbox by mailbox, so sending stays safe while you focus on the replies coming in.
- → Reply tracking is the built-in metric, not opens or clicks, because that's the number that actually turns into a meeting.
